

UnifyID SensorPrint™

UnifyID's SensorPrint is the most advanced device fingerprinting technology on the market. Every sensor has microscopic differences introduced in the manufacturing process. SensorPrint uses a proprietary technique to extract information unique to each sensor for device fingerprinting.

Unlike most device fingerprinting technology, SensorPrint matches the actual physical device, so in most cases it works across configuration changes, app deletion, and factory reset. The service allows app developers to build custom device identification solutions for their customers and end users.

Powerful, Customizable Device Identification

The **SensorPrint API** allows developers to check if a new sensor reading from a device matches any of the SensorPrints which already exist in the system.

Pricing

Pay-as-you-grow	With monthly minimum commitment	Enterprise license
\$1 per 1,000 identifications	20% discount over pay-as-you-grow	Contact Us

Keep track of your devices with SensorPrint by UnifyID
